חיפוש במאגרי מידע במוזיקה מדריך עבור המגמה לתרפיה במוזיקה

Music Index

נכתב על-ידי אפרת מור

תוכך המדריך:

- (3) מהם מאגרי מידע ביבליוגרפיים. 1
 - (4-8) 2. כניסה למאגר
- (9-42) Music Index .3
- (22) HTML תוצאות חיפוש עם טקסט מלא בפורמט או כלינק לפורמט תוצאות חיפוש עם קישור מסוג אחר לטקסט מלא (34)

במוזיקה קיימים שני מאגרי מידע ביבליוגרפיים: Music Index RILM Abstracts of Music Literature

מאגרים ביבליוגרפיים מכילים רשומות ביבליוגרפיות המייצגות ומתארות מקורות מסוגים שונים: מאמרים, ספרים, עבודות M.A. עבודות דוקטורט ועוד.

> לרבים מן המאמרים נוסף הטקסט המלא לצד הרשומה הביבליוגרפית שלהם

Academic Search Complete

Academic Search Complete is the world's most valuable and comprehensive scholarly, multi-disciplinary full-text database, with more than 8,500 full-text periodicals, including more than 7,300 peer-reviewed journals. In addition to full text, this database offers indexing and abstracts for more than 12,500 journals and a total of more than 13,200 publications including monographs, reports, conference proceedings, etc. The database features PDF content going back as far as 1887, with the majority of full text titles in native (searchable) PDF format. Searchable cited references are provided for more than 1,400 journals.

MEDLINE provides authoritative medical information on medicine, nursing, dentistry, veterinary medicine, the health care system, pre-clinical sciences, and much more. Created by the National Library of Medicine, MEDLINE uses MeSH (Medical Subject Headings) indexing with tree, tree hierarchy, subheadings and explosion capabilities to search citations from over 5,400 current biomedical journals.

MLA Directory of Periodicals

The *MLA Directory of Periodicals*, produced by the Modern Language Association (MLA), provides detailed information on thousands of journals and book series in the fields of literature, language, linguistics, film, rhetoric and composition, and folklore. Entries cover publication details, contact information, submission requirements and editorial policies, subscription terms, electronic availability and advertising, and useful statistics such as circulation, average number of articles submitted and published, time from submission to decision, and time from decision to publication. All periodicals and book series indexed in the MLA International Bibliography are listed in the directory.

More Information

MLA International Bibliography

Produced by the Modern Language Association (MLA), the *MLA International Bibliography* is the definitive index for the study of language, literature, linguistics, rhetoric and composition, folklore, and film, covering scholarly publications from the early 20th century to the present. International in scope, it includes citations to journal articles, books, articles in books, series, translations, scholarly editions, websites, and dissertations, with links to full text in JSTOR, Project MUSE, and other resources. The database also includes the *MLA Directory of Periodicals* and the *MLA Thesaurus*, a proprietary, searchable collection of thousands of subject terms, and personal names used in indexing the bibliography.

1. Drumming through trauma: Music therapy with post-traumatic soldiers

Academic

Journal

By: Bensimon, Moshe; Amir, Dorit; Wolf, Yuval. Arts in Psychotherapy. Feb2008, Vol. 35 Issue 1, p34-48. 15p. Abstract: Abstract: Combat stress reaction is common among soldiers and can develop to a post-traumatic stress disorder (PTSD). This distressing condition embraces symptoms such as feelings of loneliness and isolation from society, intrusive memories, outbursts of anger and generalized feelings of helplessness. Drumming has been receiving considerable attention in music **therapy**. Only few references relate to such activity among those who suffer from PTSD, and even fewer relate to combat induced post-traumatic syndrome, none of them empirical. The current study presents music **therapy** group work with six soldiers diagnosed as suffering from combat or terror related PTSD. Data were collected from digital cameras which filmed the sessions, open-ended in-depth interviews, and a self-report of the therapist. Some reduction in PTSD symptoms was observed following drumming, especially increased sense of openness, togetherness, belonging, sharing, closeness, connectedness and intimacy, as well as achieving a non-intimidating access to traumatic memories, facilitating an outlet for rage and regaining a sense of self-control. [Copyright &y& Elsevier] DOI: 10.1016/j.aip.2007.09.002. (*AN: 29992126*)

6. The trauma of parting: Endings of music therapy with children with autism spectrum disorders.

Academic

Journal

By: Kim, Jinah. Nordic Journal of Music **Therapy**. Oct2014, Vol. 23 Issue 3, p263-281. 19p. Abstract: Some children with autism spectrum disorders (ASE) are intensely affected by separation and changes in **therapy**. They tend to display varying degrees of difficulties in dealing with holidays, breaks and the closure of music **therapy**. This difficure, is often intensified when the child is strongly attached to the therapist and has precarious awareness of what ending means, and yet lacks the capacity for emotional self-regulation. Preparing children for parting might bring about excessive anxiety, overwhelming distress and even the fear of death and dying that the child finds difficult to contain or to articulate in words. This article explores and examines clinical phenomena and issues of ending in improvisational music **therapy** with children with ASD and how the difficulty is addressed, contained and transformed in spontaneous interaction (both musical and non-musical), between the therapist and the child. In order to enhance a better understanding of the phenomena of endings, some fundamental aspects of the mutual music making process in music **therapy** and its consequences in the therapeutic relationship are described and linked to issues of endings in different stages of music **therapy**. The role of the music and the therapist in helping the child to cope with endings in music **therapy** will be discussed in depth through clinical vignettes within the psychodynamic perspectives. [ABSTRACT FROM AUTHOR] DOI: 10.1080/08098131.2013.854269. (AN: 98308070)

The trauma of parting: Endings of music therapy with children with autism spectrum disorders

Jinah Kim*

Department of Arts Therapy, Arts Therapy Research Center, Jeonju University, Jeonju, Korea

(Received 29 August 2011; accepted 29 August 2013)

Some children with autism spectrum disorders (ASD) are intensely affected by separation and changes in therapy. They tend to display varying degrees of difficulties in dealing with holidays, breaks and the closure of music therapy. This difficulty is often intensified when the child is strongly attached to the therapist and has precarious awareness of what ending means, and yet lacks the capacity for emotional self-regulation. Preparing children for parting might bring about excessive anxiety, overwhelming distress and even the fear of death and dying that the child finds difficult to contain or to articulate in words.

This article explores and examines clinical phenomena and issues of ending in improvisational music therapy with children with ASD and how the difficulty is addressed, contained and transformed in spontaneous interaction (both musical and non-musical), between the therapist and the child. In order to enhance a better understanding of the phenomena of endings, some fundamental aspects of the mutual music making process in music therapy and its consequences in the therapeutic relationship are described and linked to issues of endings in different stages of music therapy. The role of the music and the therapist in helping the child to cope with endings in music therapy will be discussed in depth through clinical vignettes within the psychodynamic perspectives.

Keywords: trauma; endings; autism spectrum disorders; improvisational music therapy

Introduction

Many disturbed children have difficulties about separation. For all human beings a parting is like a little death. (Alvarez, 1992, p. 22)

In psychodynamic music therapy, endings are announced and prepared in advance so that their effects can be dealt with in the session. In dealing with endings, I have recognized certain issues emerging and repeating in a similar, but

Methodische Modifikationen für die musiktherape on Patienten mit Traumafolgestörungen.

Methodological modifications for music **therapy** treatment of patients with post-trauma disorders. By: Keller, Jürgen; Strehlow, Gitta; Wiesmüller, Edith; Wolf, Hanns-Günter; Wölfl, Andreas. Musiktherapeutische Umschau. Apr2018, Vol. 39 Issue 1, p12-22. 11p. Language: German. Abstract (English): On the basis of new findings and fundamental changes in the therapeutic treatment of patients with Post-Traumatic Stress Disorder, the article describes methodological conclusions for music **therapy**. Following a short selection of the most important fundamentals of trauma therapy, the authors briefly discuss the potential of music, the forming of music-therapeutic relationship and therapeutic attention to the risks of music. Appropriate interventions are outlined exemplarily. Finally, facets of a music therapy view of trauma treatment are presented. The article is an essence from the round table event of the »European Music Therapy Congress 2016« in Vienna on the same topic. [ABSTRACT FROM AUTHOR] DOI: 10.13109/muum.2018.39.1.12. (AN: 130216333)

Abstract

Combat stress reaction is common among soldiers and can develop to a post-traumatic stress disorder (PTSD). This distressing condition embraces symptoms such as feelings of loneliness and isolation from society, intrusive memories, outbursts of anger and generalized feelings of helplessness. Drumming has been receiving considerable attention in music therapy. Only few references relate to such activity among those who suffer from PTSD, and even fewer relate to combat induced posttraumatic syndrome, none of them empirical. The current study presents music therapy group work with six soldiers diagnosed as suffering from combat or terror related PTSD. Data were collected from digital cameras which filmed the sessions, open-ended in-depth interviews, and a self-report of the therapist. Some reduction in PTSD symptoms was observed following drumming, especially increased sense of openness, togetherness, belonging, sharing, closeness, connectedness

Case Study of Early Childhood Trauma Using a Neurobiological Approach to Music Therapy

Bethany Wentling, Gene Ann Behrens, PhD, MT-BC (Advisor)

Music Therapy Perspectives, Volume 36, Issue 1, Spring 2018, Page 131, https://doi.org/10.1093/mtp/miy003

Published: 12 February 2018

While treatment protocols based on the neurobiology of trauma exist for adults (van der Kolk, 2015), limited strategies are available when working with children abused at infancy (Black, Woodworth, Tremblay, & Carpenter, 2012). Recent research suggests that how music is processed in the brain can be used to create safe, predictable, motivating interactions that have the potential to help children develop neural plasticity, higherorder processing, and self-regulatory behaviors (Stegemöller, 2014). 12. The roles of music amongst musician Holocaust survivors before, during, and after the Holocaust.

Academic Journal By: Fisher, Atarah; Gilboa, Avi. Psychology of Music. Nov2016, Vol. 44 Issue 6, p1221-1239. 19p. Abstract: The aim of this study is to qualitatively examine the roles of music for musician Holocaust survivors during the Holocaust and whether and how it helped them cope with its effects. Seven musician Holocaust survivors aged 73–95 were interviewed. Interpretative Phenomenological Analysis of the transcribed interviews indicated five chronological periods where music had different roles: (1) prior to the Holocaust (e.g., as a means to create identity), (2) the outset of the Holocaust (e.g., as a means to maintain normalcy), (3) during the Holocaust (e.g., as a means of escape), (4) the aftermath of the Holocaust (e.g., as a means to promote rehabilitation) and, (5) present day (e.g., as a means to commemorate the past). A sixth category that had a cross-temporal nature was termed "transitional objects," defined as musical objects that survivors clung to during and after the Holocaust for consolation. The roles of music in consolation PDF בתוצאה זו לא מופיע קובץ compared to studies that found similar as well as contrasting results a אלא צורה אחרת לקבלת טקסט מלא literature regarding uses of music for coping with trauma and in light of musicking."
